Exhibit 1: Migration Time vs. VM Memory Size

Estimated pre-copy live migration duration as a function of VM memory size under three bandwidth scenarios. The formula $T_{mig} = V_{mem} / (B_{mig} \times (1 - r/B_{mig}))$ assumes a 20% steady-state dirty rate.

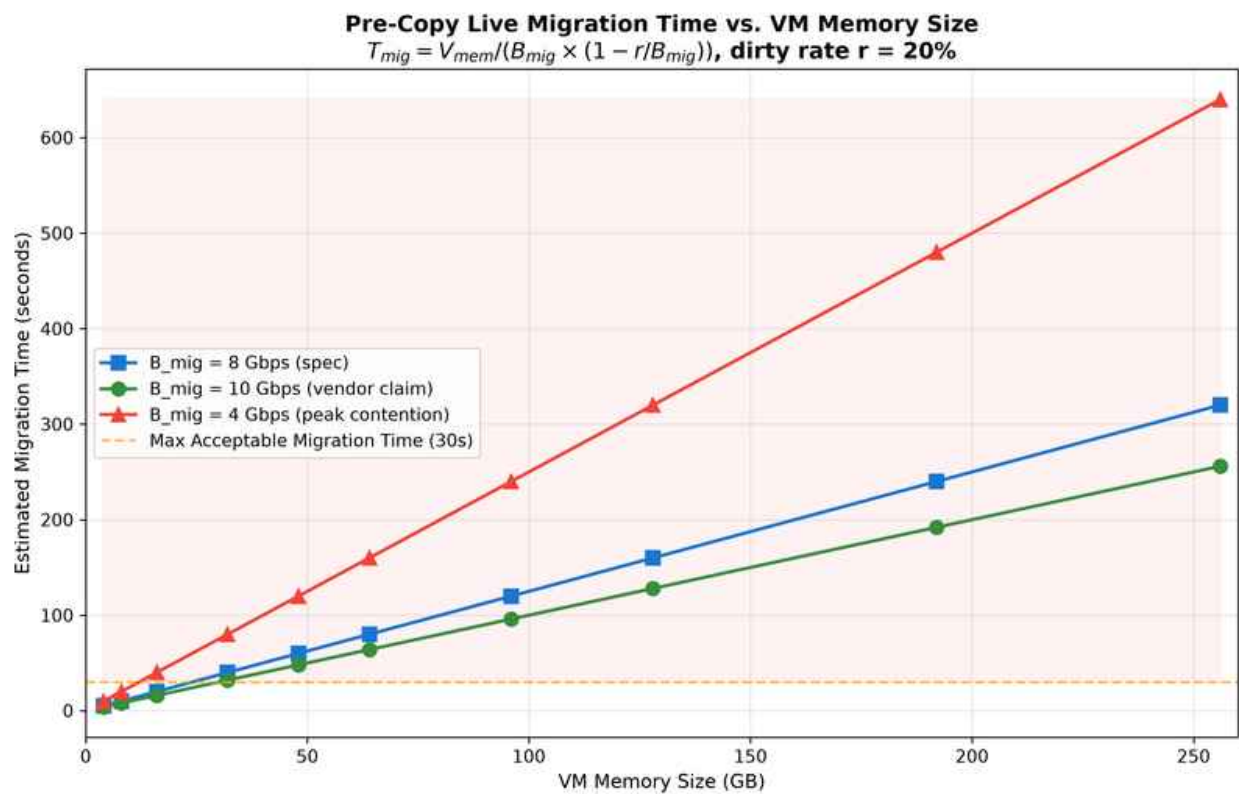

Exhibit 2: Bandwidth Contention Model

Impact of concurrent VM migrations on available bandwidth, modeled using an exponential contention function $C(n) = 1 - e^{-0.08n}$. Recommended limit of 8 concurrent migrations balances throughput against contention overhead.

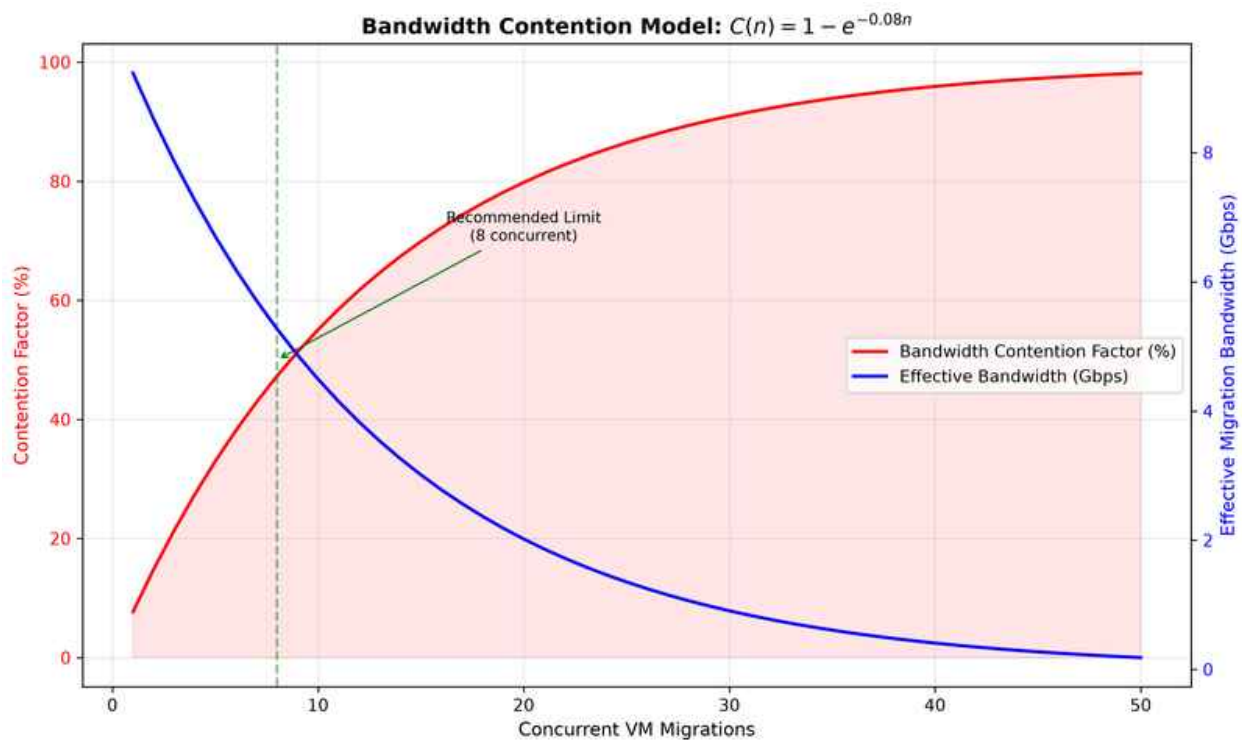

Exhibit 3: DCN Topology Comparison

Radar comparison of four data center network topologies across six evaluation dimensions derived from graph-theoretic analysis including spectral properties of the normalized Laplacian.

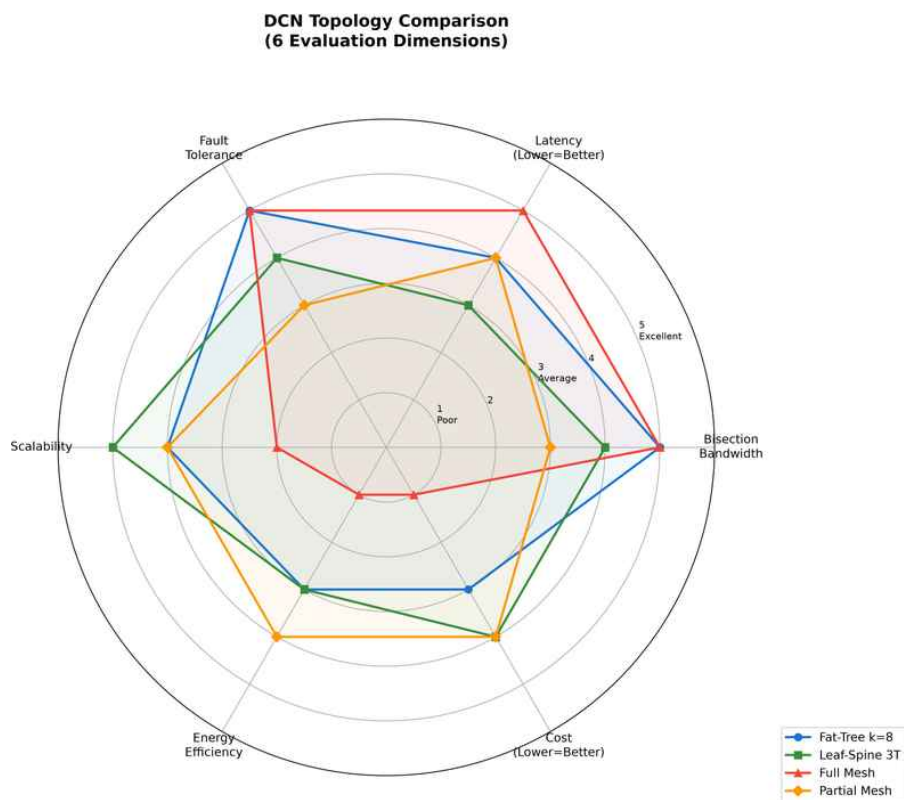

Exhibit 4: Energy per Migration Method

Stacked energy consumption breakdown for five migration methods, calculated using the host power model $P_{host} = P_{idle} + (P_{max} - P_{idle}) \times CPU_{util}^{1.4}$.

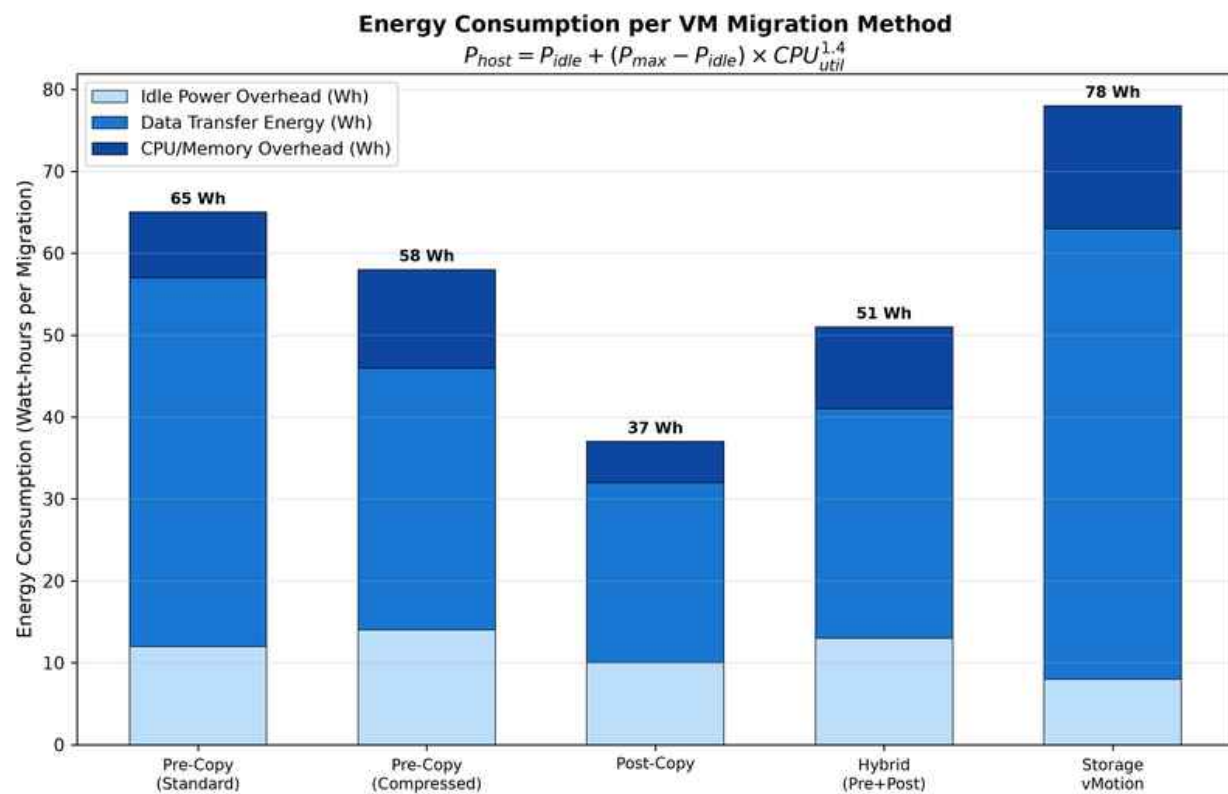

Exhibit 5: Convergence Zone Analysis

Analysis of pre-copy migration convergence behavior as the memory dirty rate approaches migration bandwidth. The convergence factor diverges when $r \geq B_{mig}$, requiring fallback to post-copy or hybrid methods.
