Exhibit 1: VM Distribution by Cluster

Distribution of 847 virtual machines across 12 vSphere clusters in both facilities. Clusters PROD-WEB and PROD-SQL carry the highest density, requiring priority attention during consolidation planning.

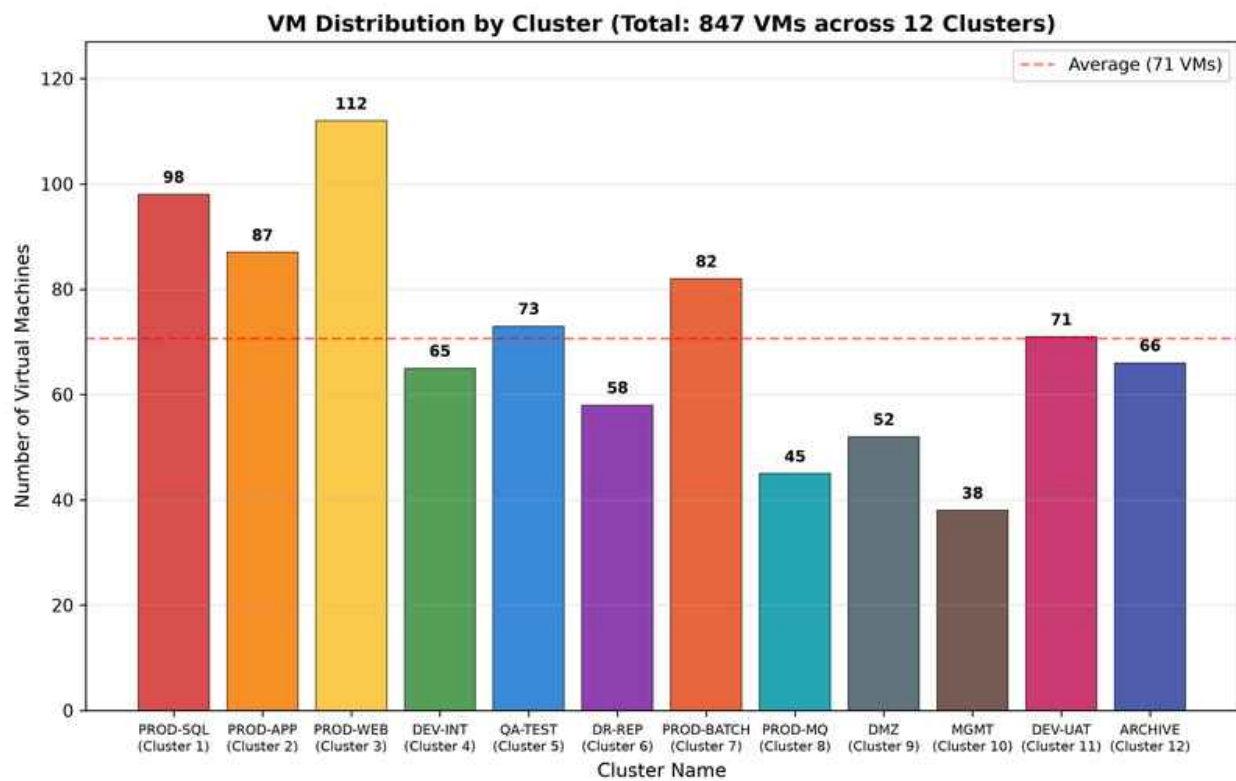

Exhibit 2: CPU Utilization Distribution

Side-by-side CPU utilization histograms for Facilities A and B, showing mean and 95th-percentile thresholds to identify right-sizing candidates.

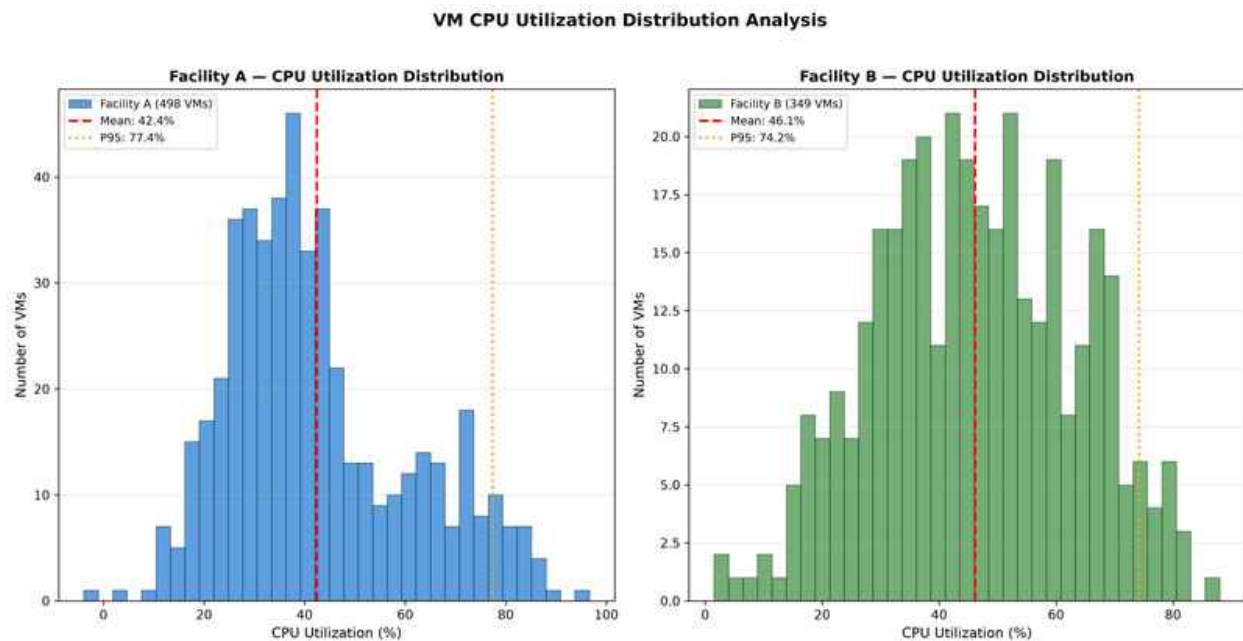

Exhibit 3: Consolidation Ratio by Wave

Progressive improvement in VM-to-host consolidation ratio from current 2.72:1 to target 6.5:1, overlaid with cumulative energy savings per wave.

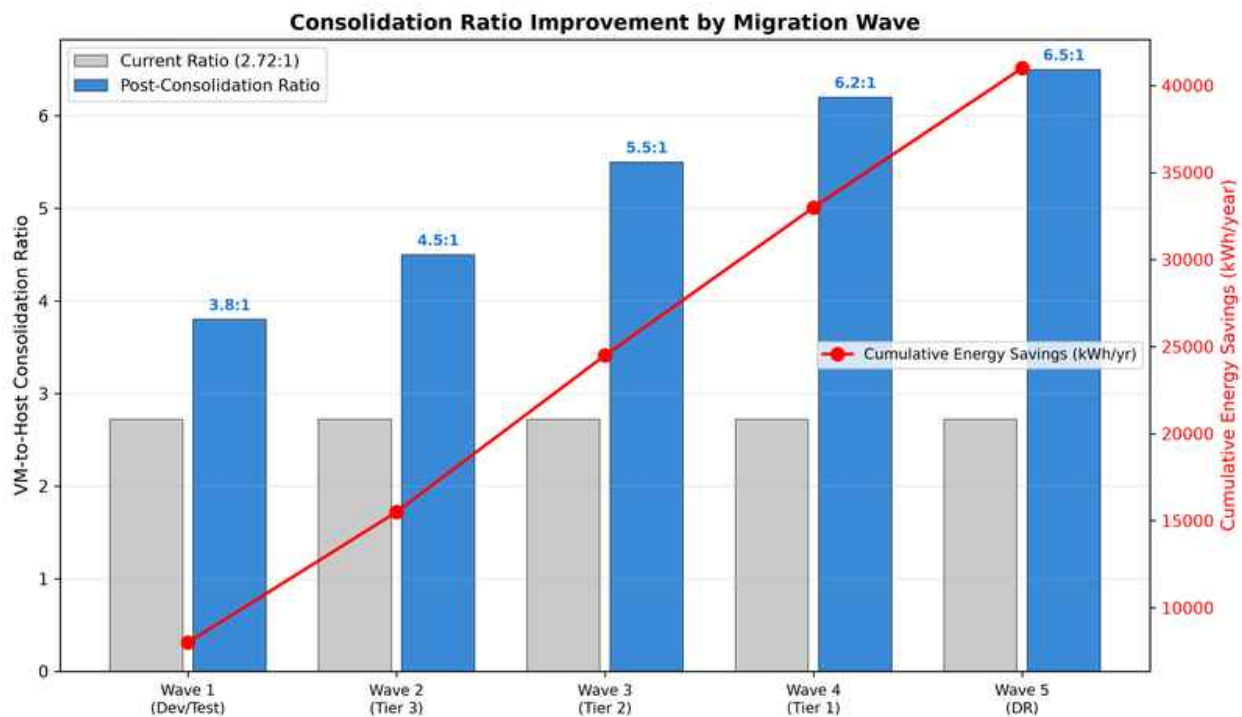

Exhibit 4: Host Migration Priority Scoring

Scatter plot of 312 physical hosts by CPU and memory utilization, colored by composite migration priority score. Hosts in the upper-right red zone require immediate attention.

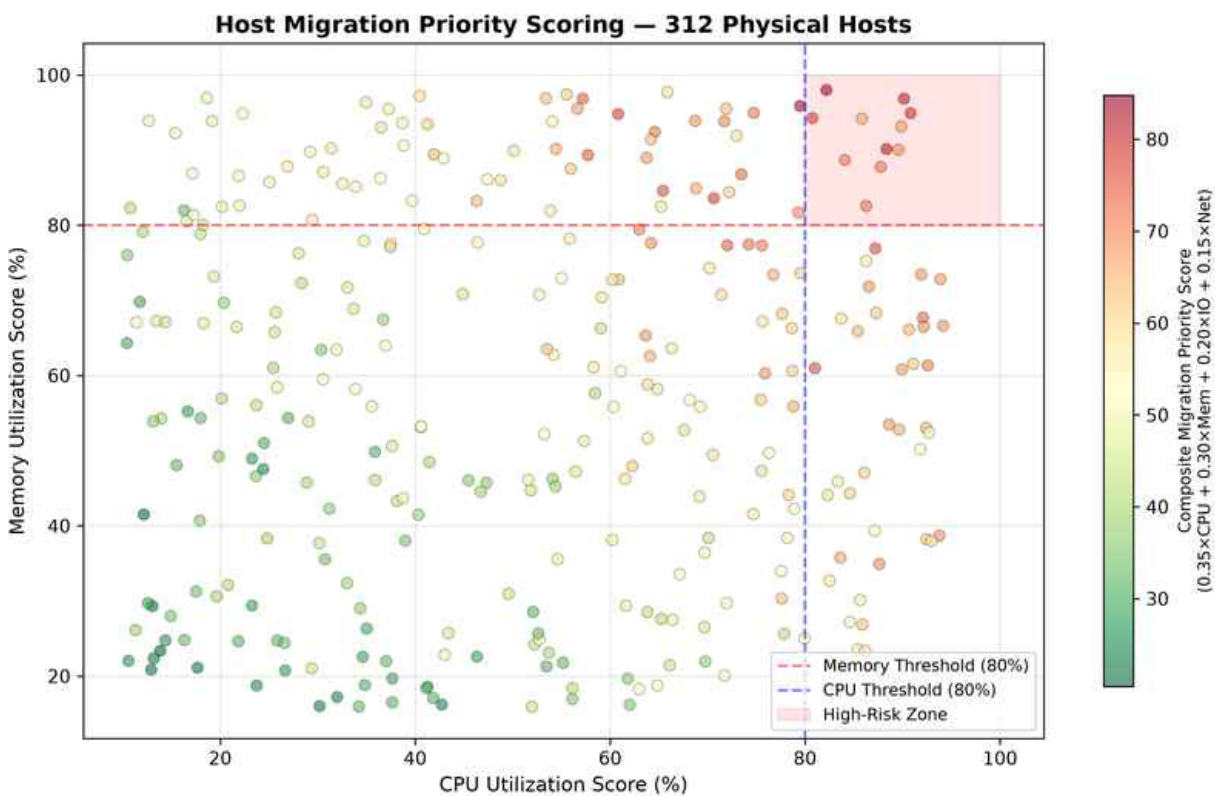

Exhibit 5: Energy Savings Projection

Projected annual energy savings and corresponding CO₂ reduction by consolidation wave, using the formula $\text{CO}_2\text{ saved} = \text{kWh}_{\text{saved}} \times 0.386 \text{ kg/kWh}$.
